

Gateway AntiVirus for E-mail

A Firebox® X Add-On Security Service

Integrated, Affordable, Comprehensive E-mail Protection

The number one security issue among network administrators is keeping viruses out of their networks. And unfortunately, most of those come through the gateway as e-mail.

**88% of respondents to ICSA's
Computer Virus Prevalence Survey 2003
reported e-mail-borne infection.**

For small- to mid-sized businesses looking to put some extra muscle behind their e-mail protection, the challenge is finding a product that is affordable and easy to integrate into the overall security infrastructure.

For WatchGuard® Firebox® X owners, there's a solution

WatchGuard now offers Gateway AntiVirus (AV) for E-mail, an additional layer of security when you're looking for superior protection from e-mail-borne viruses.

Gateway AV for E-mail provides robust signature-based protection, with more than 22,000 virus signatures, updated within hours of new threats emerging. This signature protection works in concert with deep application inspection, which identifies unknown threats and stops them before they can attack.

Gateway AV for E-mail is incorporated into the integrated, centralized management of your Firebox X. Like all Firebox X subscription-based services, including WebBlocker and SpamScreen, it can be managed using WatchGuard's central management solution, WatchGuard System Manager (WSM).

Because the service is integrated into the Firebox X, there is no new hardware to buy. A single subscription provides network-wide protection for all users configured behind your Firebox X.

Gateway AV for E-mail is easy to use. New and current Firebox X customers simply purchase and activate a license key and

the service is turned on. Once activated, the service automatically updates signature files stored on the Firebox X, making updates close to effortless.

Gateway AV for E-mail interoperates seamlessly with the other security capabilities already available on the Firebox X to provide a full suite of defenses against worms, viruses, spam, intrusion attacks, and blended threats.

Features and Benefits

■ Automated signature updates

Continually checks for new and updated signatures from a high-availability server array. You can update your virus signatures at regular intervals that you determine, for continuous and timely protection.

■ Optimized for better performance

Scans only the SMTP traffic that has successfully passed deep application inspection, so your network resources aren't tied up in repetitive steps that degrade performance.

■ Scans all major compression attachments

Supports scanning of compressed attachments including ZIP, RAR (2.0), TAR (POSIX), GZIP, ARC, MS OLE2, and MS SZDD for solid protection from viruses within compressed files.

■ Logs, monitors, and reports on all antivirus activity and signature viability

Ensures you have a real-time view of all antivirus activity. You remain informed and in control.

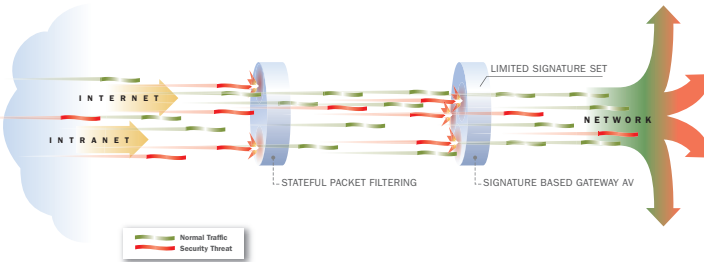

■ Thorough signature database

Includes a growing database with more than 22,000 signatures of the most active global threats, extending well beyond the current WildList.

An Intelligent Security Architecture: Better Security, Better Performance

Traditional systems do not effectively handle threats at multiple layers, so as network traffic levels increase, performance decreases. With traditional systems you get reactive, signature-based protection from a limited signature set and a performance problem as the level of traffic increases.

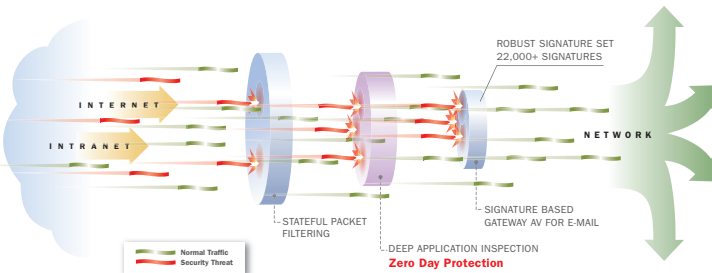

Traditional Appliance-based Gateway Antivirus Protection

Traditional appliance-based gateway antivirus solutions deliver limited signature-based protection and lower performance.

In contrast, WatchGuard has integrated zero day protection through deep application inspection into the Firebox X. Zero day protection delivers a proactive defense against emerging threats, often before the threat is defined and a signature is developed. This capability blocks approximately 80% of all viruses on the Firebox X today.

WatchGuard® Gateway AntiVirus for E-mail with Zero Day Protection

Gateway AntiVirus for E-mail, integrated with deep application inspection for zero day protection, gives you better security and better performance.

As threats are detected at each subsequent layer, less traffic needs to be inspected. When threats finally reach the Gateway AV for E-mail layer, there is less traffic to scan, thereby increasing the efficiency of the system overall. With intelligent integration of zero day protection and gateway antivirus, you'll retain the level of performance and security you require.

Expand Firebox X with Add-On Services and Upgrades

Add features and services to Firebox X to expand your security appliance as your needs grow. Get spam blocking with SpamScreen, Web filtering with WebBlocker, more network ports, and additional mobile user VPN clients. With WatchGuard solutions, you can get on with your work and rest assured that your network is protected.

System Requirements

- WatchGuard Firebox X running WatchGuard System Manager 7.3 or later
- Microsoft® Windows 2000, Windows NT, or XP
- SMTP server
